

Project Guideline for Undergraduate Students *Faculty of Informatics*

12/8/2019

Prepared by

1. FEDLU NURHUSIEN (COMPUTER SCIENCE)
2. ASSEFA CHEKOLE (INFORMATION SCIENCE)
3. GIRMA SISAY (INFORMATION SYSTEMS)
4. HABTAMU TEGENE (INFORMATION TECHNOLOGY)

UNIVERSITY OF GONDAR

Preface

Faculty of Informatics is one of the academic programs in the University of Gondar. It was established in June, 2016. The Faculty established with four field of studies namely, Computer Science, Information Technology, Information System, and Information Science. Formerly all departments have been managed under the college of natural and computational sciences. Currently, the Faculty has undergraduate and postgraduate programs in regular and extension as well as Sumer bases.

The postgraduate programs found in the Faculty of Informatics have been mentioned as follows: Master of Science Degree in Computer Science, Master of Science Degree in Information Technology, Master of Science Degree in Data Science and Analytics, and Master of Science Degree in Information Systems. Moreover, the Faculty is participated on income generation through continuing education and the staff members are actively participated in researches, community service, and technology transfer projects. So as the Faculty plays a great role on the improvement of educational quality in the University of Gondar as well as for national level.

In order to successfully complete the undergraduate and post graduate degree programs the students should conduct a group project work and individual thesis work respectively. Therefore, the purpose of this guideline is to govern the undergraduate student's group project work for keeping uniformity across the four departments. In addition, this guideline determines the components included in project proposal and final report writing, project evaluation mechanisms, and implementation rules as well as methods to handle plagiarisms.

Table of Contents

Preface	i
1. Objective of this Guideline.....	1
2. Project Documentation Writing Format	2
3. Description of the Project Outlines.....	5
4. Document Style and Formatting Instructions	16
5. Power point preparation and formatting instructions	17
6. Progress report	19
8. Roles of project coordinators.....	20
9. Time schedule for defense.....	20
10. Plagiarism and related issues.....	21
Appendices.....	26
References	28

1. Objective of this Guideline

For Students:

- To have a good insight on the rules and procedures that should be followed in their final project document writing, system analysis, system design, system modeling and implementation phases.
- To develop their project using a consistent format
- To understand about the advising time frames and the evaluation methods.

For Advisors:

- To use a consistent project outlines in order to advise the students
- To timely control the student's project progress and to report it as of the schedule.
- To evaluate the students project work using a consistent format

For project Coordinators:

- To facilitate the progress of the students project between the students and advisors
- To implement a uniform students project evaluation across departments

2. Project Documentation Writing Format

The project report is an extremely important aspect of the project. It serves to show what you have achieved and should demonstrate that:

- You understand the wider context of computing or system development by relating your choice of project, and the approach you take, to existing products or research.
- You can apply the theoretical and practical techniques taught in the course to the problem you are addressing and that you understand their relevance to the wider world of computing or system development.
- You are capable of objectively criticizing your own work and making constructive suggestions for improvements or further work based on your experiences so far.

This section encompasses the following preliminary pages and the main reports of the project accomplishments, next to the preliminary pages the remaining main body of the report will be organized in the form of chapter headings.

2.1 Outlines of the Project Document

Preliminary Pages

- i. Title Page
- ii. Approval Sheet
- iii. Acknowledgements
- iv. Table of Contents
- v. List of Figures
- vi. List of tables
- vii. Acronyms
- viii. Executive project Summary

Chapter 1: Introduction

- 1.1 Background of the project
- 1.2 Statement of the Problem and Justification
- 1.3 Objective of the Project
 - 1.3.1 General objective
 - 1.3.2 Specific objectives
- 1.4 Scope of the Project
- 1.5 Limitation of the Project
- 1.6 System Development Methodology

- 1.6.1 System development Approach
- 1.6.2 System Development Tools
- 1.7 Significance of the Project
- 1.8 Beneficiaries of the project
- 1.9 Feasibility Study
- 1.10 Project schedule
- 1.11 Project Budget

Chapter 2: Requirement Analysis

2.1 Current System Description

- 2.1.1 Major function of current system
- 2.1.2 Problem of Existing System

2.2 Requirement Gathering

- 2.2.1 Requirement Gathering Methods
- 2.2.2 Business Rules

2.3 Proposed System Description

- 2.3.1 Overview
- 2.3.2 Functional Requirements
- 2.3.3 Nonfunctional requirements
 - 2.3.3.1 Performance
 - 2.3.3.2 Scalability
 - 2.3.3.3 Availability
 - 2.3.3.4 Reliability
 - 2.3.3.5 Maintainability
 - 2.3.3.6 Security
 - 2.3.3.7 Environmental
 - 2.3.3.8 Usability
 - 2.3.3.9 Interoperability

Chapter 3: System Model

- 3.1 Scenario
 - 3.1.1 Use Case Model
 - 3.1.2 Use Case Diagram
 - 3.1.3 Description of Use Case Model

- 3.1.4 Activity Diagram
- 3.1.5 Object Model
- 3.1.6 Data Dictionary
- 3.1.7 Class Model
- 3.1.8 Dynamic Modeling
- 3.1.9 User Interface

Chapter 4: System Design

- 4.1 Introduction
- 4.2 Current software architecture (if any)
- 4.3 Proposed software architecture
 - 4.3.1 System Decomposition
 - 4.3.2 Hardware/ software mapping
 - 4.3.3 Persistent data modeling
 - 4.3.4 Access control and security
 - 4.3.5 Detailed class diagram
 - 4.3.6 Package Diagram
 - 4.3.7 Deployment

Chapter 5: Implementation

- 5.1 Mapping Models to Code
- 5.2 Screen Images
- 5.3 Testing and Evaluation
- 5.4 System maintenance

Chapter 6: Conclusion and Recommendation

- 6.1 Conclusion
- 6.2 Recommendation

Reference

Appendix

3. Description of the Project Outlines

i. Title page

See appendix 1 for the title page format.

ii. Approval Sheet

See appendix 2 for the approval sheet format.

iii. Acknowledgements

Acknowledgement in scientific literature writing is a statement of gratitude for friends, family, instructors, advisors, organizations etc. for assistance in producing a specific work. Receiving a credit by way of acknowledgment indicates that the person or organization did not have a direct hand in producing the work in question, but may have contributed criticism, or encouragement to the performer(s). Apart from citation, which is not usually considered to be an acknowledgment, but acknowledgment of conceptual support is widely considered to be the most important for identifying intellectual debt.

iv. Table of Contents

A table of contents, may be headed simply "Contents," is an organized list of divisions (chapters or articles) and the pages on which they start or the place where they may be found in the order in which the parts appear. The contents usually includes the titles or descriptions of the first-level headers, such as chapter titles in longer works, and often includes second-level or section titles (A-heads) within the chapters as well, and occasionally even third-level titles (subsections or B heads). Table of Contents as a gateway through the document shall automatically be indexed or generated.

v. List of Figures

The list of figures identifies the titles and locations of visuals (figures, drawings, photos, maps) in a research documents. Figures concentrate information in unusual ways and show critical details, configurations, and evidence.

Often Advisors, reviewers and readers review them independently of other sections of a report. If figures do not accompany your report or article, look for ways to include them. Figure titles are capitalized, and figures are numbered consecutively in Arabic number through the report. In a larger document, the figure number may be in two parts, the first part referring to the section number: for example, "Figure 3-5" for the fifth figure in Chapter 3. Be sure the figure captions are descriptive.

vi. List of tables

Tables are used for organizing information in a structural approach, so when you use tabular presentation for the information, the list of tables should be maintained including the captions and locations (page numbers referred)

vii. Acronyms

Acronyms are an abbreviation formed from the initial letters of other words and pronounced as a word (e.g. **ASCII**: is the acronyms for American Standard Code for Information Interchange, and **NASA**: stands for National Aeronautics and Space Administration). So abbreviations which is found on your document should be stated to show its normal meanings/long forms.

viii. Executive project Summary

This section will contain the overview of what you accomplished in the project. This section will provide a high level view for the readers and examiners to easily understand what you have done. You should clearly state the motivation, problem statement, approach and significance of the project.

Chapter 1: Introduction

Your introductions should not exceed two pages (double spaced, typed). The purpose of an introduction is to acquaint the reader with the rationale behind the work, with the intention of defending it. It places your work in a theoretical context, and enables the reader to understand and appreciate your objectives. When writing the introduction, you should consider the following:

- Use past tense except when referring to established facts. After all, the paper will be submitted after all of the work is completed.
- Organize your ideas, making one major point with each paragraph.
- Present background information only as needed in order support a position. The reader does not want to read everything you know about a subject.
- State the objective precisely - do not oversimplify.
- As always, pay attention to spelling, clarity and appropriateness of sentences and phrases.

1.1 Background of the project

The background section of the report should set the project into context by relating it to existing published work which you read at the start of the project when your approach and methods were being considered. There are usually many ways of solving a given problem, and you shouldn't just pick one at random. Describe and evaluate as many alternative approaches as possible. The

background section can be included as part of the introduction but is usually better as a separate chapter, especially if the project involved significant amount of prior research. The published work may be in the form of research papers, articles, text books, technical manuals, or even existing software or hardware of which you have had hands-on experience. You must acknowledge the sources of your inspiration. You are expected to have seen and thought about other people's ideas; your contribution will be putting them into practice in some other context. However, avoid plagiarism: if you take another person's work as your own and do not cite your sources of information/inspiration you are being dishonest; in other words you are cheating. When referring to other pieces of work, cite the sources where they are referred to or used, rather than just listing them at the end.

1.2 Objective of the Project

Objectives are specifically for targets within the general goal. Objectives are time related to achieve a certain task. Objectives are measurable activities achieved goals; the end points envisioned. These objectives might be, for example, development of a specified measurement capability that meets a prescribed accuracy, data rate, instrument packaging characteristics (size, weight, etc.), and other possible requirements.

The objectives section of the project is typically very brief, usually a half-page at most. This is because the rationale for objectives could also be explained in the problem statement, while the ways of achieving the objectives should be explained in the methodology section. Indicating both the general and specific objectives of the project will be important.

- The General objectives provide a short statement of the development goal being pursued by the project.
- The Specific objectives are operational in nature. They may indicate specific types of knowledge to be produced, certain audiences to be reached, and certain forms of capacity to be reinforced. These are the objectives against which the success of the project will be judged. It is important to distinguish the specific objectives from the means of achieving them.

1.3 Statement of the Problem and Justification

Give a brief, general statement of the problem to be investigated or solved by the system. Explain what your system has found out or show. This section should normally make up one of the significant parts of the project.

1.4 Scope of the project

Project scope is a general guide which used to cover as a tool to define and group a project's discrete work elements in a way that helps organize and define the total work scope of the project. Therefore the students are required to define the specific boundaries of the project in terms of what the system must do.

1.5 Limitation of the project

Limitations are shortcomings, conditions or influences that cannot be controlled by the Project team. Any limitations that might influence the results should be mentioned. Describe the problems you expect to encounter and how you hope to solve them. For example, texts might be unavailable, necessitating travel to other libraries or use of inter-library loan facilities; people you had hoped to interview might be unavailable or unwilling to participate, necessitating that you select other interviewees or change the focus; internet sites might be down or no longer available, etc. (Try to imagine every possible problem so that you have contingency plans and the project doesn't become disrupt.)

1.6 System Development Methodology

Nowadays, there are different system development methodologies that helps to achieve the objectives of small scale up to large scale system projects. Hence, the students should select the appropriate system development approaches that meets their proposed system, when selecting their system development approach, the students should justify the selected approaches (why it is preferred than other approaches).

In addition, there need to be conduct a criteria based comparison about the features of the top ranked system development approaches. The students also required to mention the system development tools used in terms of hardware and software paradigms.

1.7 Significance of the Project

Here the students are required to justify the values of the new system for the community. In terms of operations, productivity, in comparison with the current system should be discussed.

1.8 Beneficiaries of the project

Here the students should mention the target beneficiaries of the new system/software.

1.9 Feasibility Study

In this section, the feasibility of the new system should be discussed clearly in terms of the following components:

- Economic feasibility

- Operational feasibility
- Technical feasibility
- Time feasibility
- Legal feasibility...and so on.

1.10 Project Schedule

In this section, the project time line should be prepared in line with the correspondence set of activities that will be used to control the progress of their project work. So the project time line should be prepared using Gantt chart, PERT chart or any other CASE diagramming tools.

1.11. Project Budget

This section contains the financial plan for implementing the project. It should be clear, realistic and Reasonable (affordable).

- It should be itemized according to the following:
 - Equipment
 - Stationery
 - Materials
 - Software
 - Hardware
 - Transportation costs
 - Other costs such as Secretarial, Photocopying, Printing and Binding

Chapter 2: Requirement Analysis

1.1 Current System Description

1.1.1 Major function of current system

1.1.2 Problem of Existing System

1.2 Requirement Gathering

1.2.1 Requirement Gathering Methods

There are different types of requirement gathering techniques, the student should carefully meet this section in order to develop a successful system. Studies conducted regarding system requirements shows that, the most reason for the systems to be failed is due to lack of collecting appropriate requirements. Therefore, the students are required to present the detailed requirements that have been collected.

1.2.2 Business Rules

List any operating principles about the product, such as which individuals or roles can perform which functions under specific circumstances. These are not functional requirements in themselves, but they may imply certain functional requirements to enforce the rules.

1.3 Proposed System Description

1.3.1 Overview

1.3.2 Functional Requirements

In this section, the students need to clearly mention what the new system intends to do.

1.3.3 Nonfunctional requirements

In this section, the students should discuss about the characteristics of the new system in terms of the following system features.

1.3.3.1 Performance

1.3.3.2 Scalability

1.3.3.3 Availability

1.3.3.4 Reliability

1.3.3.5 Maintainability

1.3.3.6 Security

1.3.3.7 Environmental

1.3.3.8 Usability

1.3.3.9 Interoperability

Chapter 3: System Model

3.1 Scenario

Scenarios are an instance of a use case explaining a concrete major set of action. Scenario or use case realizations are just a graphical sequence of events or an instance of a use case these realizations are depicted as either sequence or collaboration diagram.

3.1.1 Use Case Model

3.1.2 Use Case Diagram

3.1.3 Description of Use Case Model

3.1.2 Activity Diagram

3.1.3 Object Model

3.1.4 Data Dictionary

3.1.5 Class Model

3.1.6 Dynamic Modeling

Document the behavior of the object model, in terms of state chart diagrams, interaction diagram (sequence diagrams and/or communication diagram).

3.1.7 User Interface (as a prototype)

In this section describe navigational paths and screen mock-ups of the proposed system interfaces.

Chapter 4: System Design

4.1 Introduction

In this section the students need to provide a brief overview of the software architecture and the design goals (Subsystem decomposition, Hardware/software mapping, Persistent data management and Access control and security). You should also provide traceability information (e.g. how the design is related to the requirement analysis done in the previous chapter, constraints impacting the software architecture).

4.2 Current software architecture (if any)

In this section, the students need to describe the Current software architecture of the system being replaced (if there is any previously implemented systems existed).

4.3 Proposed software architecture

4.3.1 System Decomposition

System decomposition describes the decomposition into subsystems and the responsibilities of each. This is the main product of system design. Here, use UML component diagram to diagrammatically depict your components.

4.3.2 Hardware/ software mapping

Hardware/software mapping describes how subsystems are assigned to hardware and off-the shelf components (if any). Here, use UML deployment diagram to diagrammatically depict the hardware/software mapping.

4.3.3 Persistent data modeling

Persistent data modeling describes the persistent data stored by the system and the data management infrastructure required for it. This section typically includes the description of data schemes, the selection of database, and the description of the encapsulation of the database. Here, use E-R diagram if you are using relational database or Object diagram if you are using object database.

4.3.4 Access control and security

Access control and security describes the user model of the system in terms of an access privilege. You can use tables to show the privilege assigned to each users of the system. This section also describes security issues, such as the selection of an authentication mechanism, the use of encryption, and the management of keys.

4.3.5 Detailed class diagram

In this section,

- Identify missing attributes and operations. During this activity, you need to examine each subsystem service and each analysis object. You need to identify missing operations and attributes that are needed to realize the subsystem service.
- Specify visibility and signatures. During this activity, you need to decide which operations are available to other objects and subsystems, and which are used only within the subsystem. You need to also specify the return type of each operation as well as the number and type of its parameters.
- Specify contracts. During this activity, we describe in terms of constraints the behavior of the operations provided by each object. In particular, for each operation, we describe the conditions that must be met before the operation is invoked and a specification of the result after the operation returns.

Here, you can use the UML class diagram to specify attributes and operations with their visibility information.

4.3.6 Package Diagram

This section describes the decomposition of subsystems into packages and the file organization of the code. This includes an overview of each package, its dependencies with other packages, and its expected usage.

Here, use UML package diagram to diagrammatically depict your packages.

4.3.7 Deployment

Since, this is the final stage in the system development life cycle to put the system in production (utilization). The students are required to show, how the system is to be deployed for the intended organization.

Chapter 5: Implementation

In this section, the programming tools and languages will be decided. The algorithms developed in the design phase are coded in the appropriate language, and component modules be tested. A well-designed user interface is of great importance to ensure that your program is well received by its intended audience.

5.1 Mapping Models to Code

In this section,

⇒ **Mapping Associations,**

- Unidirectional one-to-one associations
- Bidirectional one-to-one associations

- One-to-many associations
- Many-to-many associations

⇒ **Mapping operation contracts to exceptions,**

⇒ **Mapping the class model to a storage schema is performed.**

5.2 Screen Images

5.3 Testing and Validation

A variety of testing techniques can be brought to bear on the question, "Are the computed results correct?" The processing of some carefully chosen data will be necessary to detect typing errors, at least. The effort required for validation can be greatly reduced by taking pains to demonstrate the validity of the algorithms during the design phase. In your project report you should include a description of the tests performed and the test data used.

There are several testing methods; so you the students are required to apply some of them, such as, White Box Testing, Black Box Testing, and Acceptance Testing.

5.4 System maintenance

Chapter 6: Conclusion and Recommendation

6.1 Conclusion

In this section, summarize what you have done in the entire system development processes, basic achievements (main functions of the system), the motivations initiated to develop the system, and mention the methods and system development approaches that have been applied in order to Solve the current problems.

6.2 Recommendation

In this section the students are required to discuss about Suggestions for Better Approaches to the Problem or Project. Need to discuss about the systems feasibility to utilize for the organizational efficiency. Furthermore, the students possibly mention their Suggestions for Future Extensions (improvements) to the system.

Bibliography

Reference numbers should be cited within the text as well as figure/table captions either as *superscripts* or *enclosed in square brackets*. In this way of citation, all references should be numbered (Arabic numerals) in the order in which they are first cited in the report. Another alternative is citing references using the author's last name and the year the material published. Here, all references should be arranged in a chronological ascending order. Strictly avoid citing references in *chapter/section/subsection titles*. References are cited to convey to the reader that the idea, concept, formulation, data, inference or information being discussed is attributable to the cited literature. All figures/tables, which are taken from literature, must be acknowledged by citing the reference number or the author and the year of publication at the end of the caption.

The main reference sources include books/monographs/ handbooks, archived journal papers, conference papers in published proceedings, institutional technical reports, theses/ project documents, dissertations and other archived reports and standards. Internet websites are also increasingly becoming an important source. However, it should be noted that Internet references should not form the entire list of references. Allowing URLs as references must not be misunderstood to mean that all Internet material is acceptable. Internet material may be transitory, may not be technically reviewed and may have questionable authenticity, that is, it may not be proper archival material. It may be used as secondary information source to supplement the main sources. List references at the end of the paper in either numerical order or chronologically ascending order. Sample references could be as listed below:

For a book: author(s), book title (bold), publisher, city, and year.

Example:

[1] L. R. Rabiner and B. H. Juang. **Fundamentals of Speech Recognition**. PTR Prentice Hall Inc, Englewood Cliffs NJ, 1993.

▪ For a journal paper: author(s), paper title (bold), journal name, volume number, issue number, page numbers (inclusive), publisher, year.

Example:

[2] R. K. Aggarwal and M. Dave. **Acoustic modeling problem for automatic speech recognition system: conventional methods (Part I)**. In International Journal of Speech Technology, Vol. 14, Issue 4, pp 297 - 308, Springer Science+Business Media, 2011.

- For a proceedings paper or chapter in an edited book: author(s), paper or chapter title, volume title, editor(s) (if applicable), volume number (if applicable), page numbers (inclusive), publisher, city, year.

Example:

[3] S. T. Abate and W. Menzel. **Syllable-Based Speech Recognition for Amharic**. In Proceedings of the 5th Workshop on Important Unresolved Matters, pp. 33–40, Association for Computational Linguistics, Prague, Czech Republic, 2007.

- For an internet source: author(s), year, webpage title (bold), URL [access date].

Example:

[4] M. P. Lewis (Ed). (2009). **Ethnologies: Languages of the World (Sixteenth edition) [Online]**. Available: <http://www.ethnologue.com/> [February 05, 2013].

Note: the examples given above follows the IEEE referencing style

Appendices

This section Comprises Explanatory Notes which include project approval letters, screen shoots, project source codes and instruments like interview sample protocols etc.

4. Document Style and Formatting Instructions

The faculty has prepared the project document writing format and its description for the final project work as an outline. So that, the project document will be formatted using the following guiding instructions.

4.1 Language

The project document must be prepared in English.

4.2 Paper Size and Specification

The document must be prepared using a standard A4 (8.27" X 11.69") paper size.

Use the normal page **margins**: Top: 1'' Bottom: 1''
 Left: 1'' Right: 1''

4.3 Font Type and Size

4.3.1 For Title Page

- Font Type: Times New Roman [UPPER CASE]
- Font size: 16 [**bold**]
- For other texts on the cover page, use times new roman and 14 font size

4.3.2 Main Headings:

- Font type: Times New Roman [UPPER CASE]
- Font size: 12 [**bold**]

4.3.3 Body Text:

- Font type: Times New Roman
- Font size: 12

4.3.4 For Sub Headings:

- Font type: Times New Roman
- Font size:10 [**bold**]

4.3.5 Indentation and Line Spacing

- The line spacing between texts should be **1.5** with the exceptions of captions, lists, graphs, charts, items with tables and lists in the appendices.
- The alignment of each paragraph should be **justified**.
- Each chapter must start on a new page. Chapter titles should be centered and be as Major Heading.

4.4 Tables

- Tables should be consecutively numbered and labeled. Table numbering should indicate the chapter where it resides in.

4.5 Figures

- Figures should be consecutively numbered and labeled. Figure numbering should indicate the chapter where it resides in.

4.6 Page Numbers

- Except for the title page, number all pages which come before the first page of the body chapters consecutively with lower case roman numerals (i, ii, iii, iv...).
- The first page with Arabic numeral (1, 2, 3, and so on) starts from the page of the introduction. Put page numbers centered aligned.

4.7 Page Headers

- The header will comprise the title of the Project report. On every odd page will appear the title of the report while on the even pages the title of the chapter or section will be mentioned.
- The first page of every section or chapter shall not carry the header.

5. Power point preparation and formatting instructions

You are expected to defend your project by preparing a catchy presentation. Developing an outline or structure for your presentation will help you communicate a clear and meaningful message to your audience.

5.1 Slide Layout

- Your slides should have white background with little or no graphics.
- Your **bullet points** should be short and quick hits and try to keep the number of bulleted items around **six** per slide.

5.2 Font

- Use **Arial** font type with color **black**.
- Main body contents should be coined in 20-24 pts.
- Font type, size and style of the main content area on all slides except for the title slide should be the same.
- Title of your project should be maximum of **36 point-size**
- Each content slide should have a title and should solely reflect the comprised content.

- The titles should be brief and descriptive. They should not be full sentences.
- The title of each slide should be **30- point size**

5.3 Total number of slides

A general rule of thumb is one slide per minute. If you have a 20-minute presentation, you should include about 20 slides. You don't want to overwhelm your audience with too much information. Focus on the key concepts you want your audience to remember. However, for the sake of your defense up to 26 slides are allowable.

Notice!

This is one of the biggest mistakes most students make with PowerPoint: They cram too much text onto their slides. The text-only slides should be short, quick-hit highlights written as phrases rather than complete sentences. If your audiences are busy reading your slide, they are not going to be paying attention to you. Or they may not read the slide at all, which renders your Power Point presentation useless. So, make sure to leave some white space around the main content on your slide. This helps to focus the reader's attention on the key information.

6. Progress report

A progress report is a written document that explains how much progress is being made on the project tasks that you have previously planned. That is, it is a report of the progress that has been done on the project and reports about the ongoing project. The following are some of the rules of progress report preparation and submission guidelines.

- 6.1 Every group should submit a progress report for their respective advisor based on the specified time and date per a week.
- 6.2 Every advisor should send all the submitted progress reports to the project coordinator once per three weeks using the format attached at the annex. Here Friday of the third week is for collection of progress reports from each advisor. Hence at each month, the third week's Friday till 11:00 will be the last date for a progress report submission.
- 6.3 Every group must submit the progress report based on the work breakdown and phase by phase task divisions stated in the project document.
- 6.4 The faculty project coordinators team should handle a meeting once in a month (at the beginning date of the month), to see the progress what students and assigned advisors are doing so far. Here in case of holidays and other urgent responsibilities, the meeting date can be re-arranged based on the team agreement.

7. Roles of advisors

- 7.1 Every advisor is expected to contact one group for 2 hours per a week.
- 7.2 Per each semester there will be minimum of 14 contacts by considering the assumption of 1 week for title selection and group assignments.
- 7.3 While the group members contact their advisor, it is a must that all group members should be available during the contact hour and the advisor is expected to take attendance.
- 7.4 If there is a failure of achieving rule 7.3 for more than two contacts per month, then the advisor should report to the project coordinator of the department.
- 7.5 If students are unable to get their advisor for subsequent period of time (minimum of two consecutive contacts per month), then they should report to the department project coordinator.
- 7.6 Every advisor and project coordinator must sign in the final document that will be submitted by every groups.

8. Roles of project coordinators

- 8.1 The project coordinator is responsible to form the group among final year students. In each group the number of students shall be between 4 up to 5 members.
- 8.2 The project coordinator should represent his/her department at the faculty level during title review and related meeting that will be held in the faculty.
- 8.3 The project coordinator should organize presentation and defense sessions in both semesters.
- 8.4 The project coordinator is the responsible body to collect titles for approval, progress reports from each advisor and final project documents in that department.
- 8.5 After defense the project coordinator should collect student marks from their respective examiners and advisors. Then he/she must submit students grade using SIS system.
- 8.6 Each department project coordinators are responsible for preparing schedules in collaboration with other sister departments, assigning examiners and following over all work of the defense and they should submit the grade based on the academic calendar.
- 8.7 Since the project titles are selected with faculty level each department have a mandate to select examiners from the other sister departments.
- 8.8 Right after the title approval, the department and the project coordinator should assign an advisor for each project. While assigning the advisor, the department should consider the total load and the number of active staff in the department.
- 8.9 The project coordinator of the department will be assigned by department council and his/her term is limited to one academic year.

9. Time schedule for defense

Defense is a presentation where by students will present their final work to the examiners for final grading. The following are some of the rules before and after defense.

- 9.1 Every group must submit their final document before one week of the defense time.
- 9.2 The project coordinator must distribute the submitted project documents for examiner before 5 days of the presentation.
- 9.3 As evaluation criteria 30 marks are reserved for advisor and the remaining 70 marks are reserved for examiner. The defense results are the average marks given by all examiners during the presentation.

- 9.4 Every group must submit the corrected project document after three consecutive days of the defense date. If students failed to do so, their grade will be suspended for grade submission.
- 9.5 Defense should be done once per semester so that the students will have 2 defense schedules at their graduation year. The defense should be conducted after final exam is completed, and their grade should be done at most within the specified academic calendar.
- 9.6 For the defense, which will be conducted at both semesters, the total time allotted is 1 hour, where by 25 minutes is for presentation/demonstration and the rest 35 minutes for defense.

10. Plagiarism and related issues

Plagiarism is using the words or ideas of another as if they were your own. It can be an intentional or unintentional act, but either way there can be severe consequences. It is also unethical practice of using projects (either planned or accidental) of other students/instructor projects without proper acknowledgment and visible differences. The following are ways to manage plagiarism.

- If there is a suspect of happening plagiarism in student's project, first the examiners should report to the project coordinators of the department, and he will present for discussion with the department. Here the academic council (AUC) can go for further investigation through assigned committees. Then based on the committee report if the plagiarism level is more than 50 %, the punishment will be re-doing the project for additional semester. If the level is below 50% they should be punished to re-do and resubmit it within one month.
